

CHAPTER 6

CONCLUSION AND RECOMMENDATION

6.1. Conclusion

According to the analysis of Nonconformity analysis and problem solving based on quality control and ergonomic approaches, we can get conclusion as follows:

1. Analyzing of quality control aspect and human aspect on nonconformity problem that had been done concluded that :
 - The aspects of setting on machining process in general had stand on the requirement of setting. In other word machining setting problems were not exists during the machining process.
 - The inconsistence of quality control on cutting tool condition, inspection and cleaning of katal and scraps had resulted nonconforming dimension (not meet the specification). So those activities was the main problem that should controlled by solution.
2. Analyzing on human posture based on human capability and limitation in conducting the work (body working load and body limitation) that had been done concluded that:
 - The Highest workload had been occurred when operator comes up and down jig that result 1118 Newton and Cumulative trauma disorder conduct

on both activities (with high frequency and range of fluctuation (load range of 24.70 Newton increasing to 480.3 Newton and 20,70 to 1118 Newton) and over flexion condition had been indicated.

- Biomechanical graph result on inspection activities indicated over work load shares that will disturb the inspection process that give unstable of process quality, fatigue of work and injure in body segment and physiologies problem uncomforted situation of the process on cleaning activities was occur.
- Unduly heavy work had been classified on activities. It had been conduct in the over of human limitation risk to greatly occur the possible of fatigue quickly refer to human error and human body injured. Energy expenditure analysis result indicated that in 141.81 minute had been resulted very high total work load (769329.8092 Newton per day or 2927.0441 Newton per machining cycle). That force load value effect on the high expenditure of energy that is 18.5924 Kcal / minute. The actual resting time that less than the requirement of resting time calculation (actual = 60 minutes, recommended 126 minutes). The solution to solve it must be needed.

3. Evaluating the relationship and potential causes of Quality control and Ergonomic that influenced on existing nonconformity problem had been

concluded that Correlation of ergonomics and quality aspect on this case of study is situation of unergonomics of working environment cause high work load to body segment of operator in activity process its machinery and later then give the high expenditure energy. Fatigue and injured problems in some part of body had been occurred. Then become constraint to operator to done activities on quality control or quality operation like inspection and others, so some problems external influencing quality from process directing and influence the result from quality which in the end result the quality which is not expected.

6.2. Recommendation

The recommendation from this study are:

1. Improve the standard operational for reducing human error and physiology aspect on operator. This effort can support by standard procedural of the measurement process to improve the correctness of measurement, the use of coolant and machine setting.
2. Redesign jig facilities by analysis of anthropometric and biomechanics design support - problem solving of fatigue on biomechanics aspect design and anthropometry as human centred design.
3. Redesign the jig facilities with develop work safety device on it such as railings, ladders, levelling platform to improve the human posture during the machining process to reduce work load and high energy expenditure.

4. Redesign the job of work method to analysed the better work condition.
5. According to the Snook and Ciriello (1991) that mentioned about the correlation of frequently work load and resting time, decreasing capabilities of human muscles when done frequently work load can be solved by the arrangement of load, frequency, and time resting. Sjogaard et.al (1979) had been mentioned that to increased endurance time can be improve by the short term of rest on each of activities on process. So by applying the arrangement of the frequently short resting time on the machining process activities can reduced the fatigue problem.

For $n > 25$

$$A = \frac{3}{\sqrt{n}}, \quad A_2 = \frac{3}{c_4 \sqrt{n}}, \quad c_4 \approx \frac{4(n-1)}{4n-3}$$

$$B_3 = 1 - \frac{3}{c_4 \sqrt{2(n-1)}}, \quad b_4 = 1 + \frac{3}{c_4 \sqrt{2(n-1)}}$$

$$B_5 = c_4 - \frac{3}{\sqrt{2(n-1)}}, \quad B_{10} = c_4 + \frac{3}{\sqrt{2(n-1)}}$$

Quality Control Data on B,C,D Hole 40 mm of Diameter Boom ZX 30

APPENDIX E

ERGONOMIC ANALYSIS

Biomechanical Assumption Calculation Result on Climbing Up down Jig on Activities Code 14a, 14b, 15a, 15b, 17a, 17b, Mannequin Pro 7 Biomechanics Over Flexion Indicator, Result of Work Load on Each Body Segment, Actual Timing on Each Activities Code, Energy Expenditure Calculation.

Biomechanical Assumption On Climbing Up and down Jig on Activities Code 14a, 14b, 15a, 15b, 17a and 17b

Force assumption result on 15 a and 15 b (the red colour is force assumption for 15 a and yellow colour is force assumption for 15 b).
