

## BAB VI

### KESIMPULAN DAN SARAN

#### **6.1. Kesimpulan**

Berdasarkan proses validasi yang diperoleh dari program bantu kolom segi empat ini, selisih absolut dari perbandingan program ini dengan hasil perhitungan manual adalah 0 % dan selisih absolut terbesar dari perbandingan program ini dengan program *SPColumn* adalah 0,347 %. Selisih perhitungan tersebut masih dapat dikatakan mendekati. Artinya program ini mempunyai tingkat ketelitian yang baik, sehingga program ini layak digunakan untuk melakukan analisis kolom uniaksial berdasarkan SNI 2847 : 2013.

Dari hasil penulisan tugas akhir dan pembangunan program ini, maka dapat ditarik beberapa kesimpulan :

1. Proses analisis kolom uniaksial secara manual memakan waktu yang lama sehingga dinilai tidak efisien.
2. Program bantu kolom persegi berdasarkan SNI 2847 : 2013 terbukti lebih akurat dan efektif daripada perhitungan secara manual.
3. Program ini praktis untuk digunakan karena tanpa harus mengunduh dan menginstalnya ke komputer.

#### **6.2. Saran**

Program bantu kolom segi empat berbasis *web* berdasarkan SNI 2847:2013 ini tentu masih jauh dari sempurna dan harus banyak mengalami penyempurnaan, diantaranya :

1. Membuat sistem penyimpanan data pada program, yang bisa memudahkan pengguna untuk meninjau ulang pekerjaan yang sudah pernah dilakukan.
2. Mengembangkan program ini dengan menambahkan beban biaksial dan kolom langsing sehingga program bantu kolom menjadi lebih lengkap.
