<b>Country</b>	<a href="#">Indonesia</a> - <a href="#">SIR Ranking of Indonesia</a>	<h1>13</h1>
<b>Subject Area and Category</b>	<a href="#">Engineering</a> <a href="#">Electrical and Electronic Engineering</a>	
<b>Publisher</b>	<a href="#">Institute of Advanced Engineering and Science (IAES)</a>	H Index
<b>Publication type</b>	Journals	
<b>ISSN</b>	23029293, 16936930	
<b>Coverage</b>	2011-ongoing	
<b>Scope</b>	TELKOMNIKA (Telecommunication, Computing, Electronics and Control) ISSN: 1693-6930, e-ISSN: 2302-9293 is a peer-reviewed, scientific journal published by Universitas Ahmad Dahlan (UAD) in collaboration with Institute of Advanced Engineering and Science (IAES). The aim of this journal is to publish high-quality articles dedicated to all aspects of the latest outstanding developments in the field of electrical engineering. Its scope encompasses the applications of Telecommunication and Information Technology, Applied Computing and Computer, Instrumentation and Control, Electrical (Power), and Electronics Engineering. It was first published in 2003. Beginning with issue 1 of volume 16 (2018), TELKOMNIKA will be published as a bimonthly journal (6 issues/year). The journal registered in the CrossRef system with Digital Object Identifier (DOI) prefix 10.12928. The Journal has been indexed by SCOPUS, Google Scholar, Scholar Metrics etc; accredited 'A' Grade by DGHE (Ministry of Research, Technology and Higher Education, Republic of Indonesia); registered Directory of Open Access Journals (DOAJ), BASE - Bielefeld Academic Search Engine and CORE KMi, etc. The Journal also have a license agreement with ProQuest LLC and EBSCO Publishing.

**Rajni Bhalla** 7 months ago

Hello sir,

My paper suppose to publish in October. But still full text is not coming for this paper.As i have sent word file through mail also and uploaded on website also.Kindly let me know to whom should i contact.I have already sent mail to editor number of times.Kindly do the needful.

Thanking you

Regards

Rajni

**Mohammed Al-obaidi** 5 months ago

Hi, can I know how long the reviewing process?

**Elena Corera** 7 months ago

Dear Rajni,

thank you very much for your comment. Unfortunately, we cannot help you with your request, we suggest you contact journal's editorial staff so they could inform you more deeply. You can find contact information in SJR website <https://www.scimagojr.com>

Anyway, if there is any user who has already published in the journal, maybe could help us with your request.

Best Regards,  
SCImago Team

I want to Know how I can get the Impact Factor of any Journal

reply

**Elena Corera** 9 months ago

Dear Ahahd,

thank you very much for your request. You can consult that information in SJR website.

Best Regards,  
SCImago Team

The users of Scimago Journal & Country Rank have the possibility to dialogue through comments linked to a specific journal. The purpose is to have a forum in which general doubts about the processes of publication in the journal, experiences and other issues derived from the publication of papers are resolved. For topics on particular articles, maintain the dialogue through the usual channels with your editor.

## TELKOMNIKA (Telecommunication Computing Electronics and Control)

**TELKOMNIKA (Telecommunication, Computing, Electronics and Control) ISSN: 1693-6930, e-ISSN: 2302-9293** is a peer-reviewed, scientific journal published by Universitas Ahmad Dahlan (UAD) in collaboration with Institute of Advanced Engineering and Science (IAES). The aim of this journal is to publish high-quality articles dedicated to all aspects of the latest outstanding developments in the field of electrical engineering. Its scope encompasses the applications of Telecommunication and Information Technology, Applied Computing and Computer, Instrumentation and Control, Electrical (Power), and Electronics Engineering. It was first published in 2003. Beginning with issue 1 of volume 16 (2018), TELKOMNIKA will be published as a bimonthly journal (6 issues/year). The journal registered in the CrossRef system with Digital Object Identifier (DOI) prefix 10.12928. The Journal has been indexed by [SCOPUS](#), [Google Scholar](#), [Scholar Metrics](#) etc; accredited 'A' Grade by DGHE (Ministry of Research, Technology and Higher Education, Republic of Indonesia); registered [BASE - Bielefeld Academic Search Engine](#) and CORE KMI, etc. The Journal also have a license agreement with [ProQuest LLC](#) and [EBSCO Publishing](#).

Authors should submit only papers that have been carefully proofread and polished. Manuscripts are accepted with the understanding that they are an original or extended version of previously published papers in conferences and/or journals and that, if the work received an official sponsorship, it has been duly released for open publication. Before submission please make sure that your paper is prepared using the journal paper template. The authors must refer to TELKOMNIKA Journal for writing format and style (Please download and use as a template for initial manuscript submission in [DOCX](#) or [LATEX](#)). This will ensure fast processing and publication. Any papers not fulfilling the requirements based on the guideline to authors will not be processed.

If you have any problems with the online submission, please do email to telkomnika [at] [ee.uad.ac.id](mailto:ee.uad.ac.id) (subject: Your Name\_Problem with Online Submission), and cc: tole [at] [journal.uad.ac.id](mailto:journal.uad.ac.id), tole.uad [at] [gmail.com](mailto:tole.uad@gmail.com).

#### About ICW-TELKOMNIKA 2018 Extended Papers

Yogyakarta, Indonesia: 27 November 2018

Dear Authors,

If until now your extended paper has not yet been accepted for publication in our journal, please see Editors message below.

#### Second notice to authors

Guideline to extend papers of the 2018 1st International Conference and Workshop on Telecommunication, Computing, Electrical, Electronics and Control (2018 ICW-TELKOMNIKA)

**TELKOMNIKA Telecommunication, Computing, Electronics and Control** is a Scopus indexed journal, SJR Q3, and ONLY publishes high quality papers. A high quality paper has: (1) a clear statement of the problem the paper is addressing; (2) the proposed solution(s); and

(3) results achieved. It describes clearly what has been done before on the problem, and what is new.

The goal of your extended paper is to describe novel technical results.

There are four types of technical results:

- (1) An algorithm;
- (2) A system construct: such as hardware design, software system, protocol, etc.; The main goal of your revised paper is to ensure that the next person who designs a system like yours doesn't make the same mistakes and takes advantage of some of your best solutions. So make sure that the hard problems (and their solutions) are discussed and the non-obvious mistakes (and how to avoid them) are discussed.
- (3) A performance evaluation: obtained through analyses, simulation or measurements;
- (4) A theory: consisting of a collection of theorems.

Your extended paper should focus on:

- (1) Describing the results in sufficient details to establish their validity;
- (2) Identifying the novel aspects of the results, i.e., what new knowledge is reported and what makes it non-obvious;
- (3) Identifying the significance of the results: what improvements and impact do they suggest.

Second, change title of your paper to more suitable title. The title summarizes the main idea or ideas of your study. A good title contains the fewest possible words needed to adequately describe the content and/or purpose of your research paper. Rarely use abbreviations or acronyms unless they are commonly known. (The technical guideline how to update your paper title was submitted to corresponding authors).

**Specific Reviewers', Mentor(s)' & Editor(s)' comments were submitted to Corresponding Authors.** Please address any comments in the extended version of your paper strictly; and submit it to: [icw.telkomnika@journal.uad.ac.id](mailto:icw.telkomnika@journal.uad.ac.id), cc: [tole@journal.uad.ac.id](mailto:tole@journal.uad.ac.id) (within 8 weeks), and attach:

1. File Response to Reviewers', Mentor(s)' & Editor(s)' Comments
2. File of your revised paper

When your extended paper reached us, it will be re-checked & reviewed by Editor(s) and Mentor(s) based on your response to Mentor & Coach comments and the following criteria: Relevance, Significance, Novelty, Technical correctness, Experimental/evidential support, Clarity of presentation and Reference to prior work and publications.

**In case we found that authors do not extend his/her paper seriously, we will cashback ICW-TELKOMNIKA registration fee and REJECT his/her paper.**

I am looking forward to receiving your extended paper.

Your cooperation is very appreciated.

Thank you,

Sincerely yours,  
Tole Sutikno, Ph.D.  
General Chair, 2018 ICW-TELKOMNIKA  
Editor-in-Chief, TELKOMNIKA Telecommunication, Computing, Electronics and Control

## Call for Editors

**TELKOMNIKA Telecommunication, Computing, Electronics and Control** (Scopus indexed journal) is a peer-reviewed scientific journal publishes high-quality articles dedicated to all aspects of the latest outstanding developments in the field of electrical engineering.

TELKOMNIKA TCEC is calling for academics with sound academic background and who want to leave their footprints on the sand of time to serve as editors. Applicants must have significant publishing his/her specific field of research and reviewing experience (min **H-index: 5** in Scopus/Thomson Reuters Web of Science database).

## Abstract

*This paper describes the technique to accelerate inpainting process using fourth order PDE equation using GPU CUDA. Inpainting is the process of filling in missing parts of damaged images based on information gleaned from surrounding areas. It uses the GPU computation advantage to process PDE equation into parallel process. Fourth order PDE will be solved using parallel computation in GPU. This method can speed up the computation time up to 36x using NVIDIA GEFORCE GTX 670.*

## 1. Introduction

The Inpainting problem is the term for what researchers in image processing call “image interpolation”. Digital Image restoration technique using information gleaned from surrounding areas of image to fill the damages or missing parts of image is called inpainting. The origin of inpainting was begun in art world, it was used in restoration old oil painting. This term was firstly introduced into digital image processing in the work of Bertalmio, et al., [1].

There are many applications of image inpainting. It can be used to remove scratches automatically from digital image or film, digital restoration of ancient painting, text erasing, and connect roads in satellite image [2].

Figure 1. Inpainting Problem

In 1984, Geman and Geman used statistical approach for image restoration tasks [3]. This approach was to remove noise in the image, if the image structure was missing, this approach would be difficult to give fair result. The work of Bertalmio, et. al., introduced image inpainting as a new research area of digital image processing [1]. This work not only can remove noise, but also can repair structure of the image. The model is based on nonlinear PDE. When the damage area has large distances and complicated texture, this method will have difficulties to repair image.

A different approach to inpainting was proposed by Chan and Shen [4]. They introduced the idea that well-known variational image denoising and segmentation models can be easily

adapted to the inpainting task by a simple modification. The model can successfully propagate sharp edges into the damaged domain. However, this model exacts a penalty on the length of edges, this technique cannot connect contours across large distances. One year after that, 2002, Chan, Kang, and Shen introduced a new variational image inpainting model that addressed the shortcomings of the the total variation [5]. This method makes improvement in inpainting longer distances than before. Esedoglu and Shen adapted image segmentation to the inpainting problem [6]. This model can be solved rather quickly but this model cannot connect image across large distance.

In 2007, modified Cahn Hilliard being used for inpainting. It shown that this method give fast inpainting of binary images [2]. In 2009, Schönlieb, make research in modern PDE inpainting [7]. This research show us the advantage of fourth-order inpainting models over models of second differential order is in the smooth continuation of image contents even across large distance in the image. The research emphasise to make more research about faster numerical solvers for inpainting with higher-order equations than before.

The most recent approach to inpainting is based on fourth order PDE method [8]. There are lots of researches trying to improve the quality and to reduce processing time of inpainting process using high order PDE method [5, 8]. A number of methods were suggested to solve inpainting problem, many of which are based on advanced mathematical techniques [1, 2], [4-6], 8, 9]. This research is trying to accelerating inpainting process using different approach than advance mathematical techniques.

High performance computing on GPU using CUDA library will be used to solve image Inpainting problem. Parallelized execution of high order PDE in image Inpainting would be a feasible optimization method. We will take the advantages of GPU multicore processor to increase the application performance by executing them in GPU cores [10]. The research of Guo and He, is one of the example that the use of GPU has been significantly increase the the lattancy time in digital image processing. They can speedup fractal image compresion process to 123 times faster compare to the traditional method [11]. That research gives an opportunity another image processing algorithm to use the power of GPU to speedup computation process.

This research will answer how significant the uses of GPU to increase the lattecy time in digital image inpainting using fourth order PDE.

## 2. Inpainting Method

Inpainting digital image is essentially interpolation process on filling missing parts of an image based on surrounding areas. The solution of this problem is using fourth order PDE equation. The inpainting problem is to to reconstruct the original image  $u$  in (damaged) domain  $D \subset \Omega$  (Figure 1). Image  $f$  represent some given image defined on an image domain  $\Omega$ . The discretization in space used finite difference and spectral methods, i.e., the fast Fourier transform, to simplify the inversion of the Laplacian  $\Delta$  for the computation of  $u_{k+1}$ . The fourth order PDE inpainting equation:

$$u_t = \Delta \left( -\epsilon \Delta u + \frac{1}{\epsilon} F'(u) \right) + \lambda(f - u), \text{ in } \Omega, \quad (1)$$

The Equation (1) is the work of Betrozzi, et al., using the fourth order PDE to solve inpainting problem [2]. Based on the work of Equation (1), Schönlieb, et al., [9] built another fourth order PDE equation:

$$\frac{u_{k+1} - u_k}{\Delta t} + C_1 \Delta \Delta u_{k+1} + C_2 u_{k+1} = C_1 \Delta \Delta u_{k+1} - \Delta \left( \nabla \cdot \left( \frac{\Delta u_k}{|\Delta u_k|} \right) \right) + C_2 u_k + \lambda(f - u) \quad (2)$$

The constants  $C_1$  and  $C_2$  are positive, and need to be chosen large enough to make this equation convex. The constants  $C_1$  and  $C_2$  must fulfill the condition of  $C_1 > 1/\epsilon$ ,  $C_2 > \lambda_0$ .

This equation has been proved by Schönlieb, et al., [9] have consistency, unconditional stability, and convergence.

### 3. GPU CUDA

Commodity computer graphics chips, known generically as Graphics Processing Units or GPUs, are probably today's most powerful computational hardware for the dollar. Researchers and developers have become interested in harnessing this power for general-purpose computing, an effort known collectively as GPGPU (for "General-Purpose computing on the GPU") [10].

CUDA is a parallel programming model developed by NVIDIA was started at 2006. The first CUDA SDK was released in the early 2007. A parallel system using CUDA consists of a host (CPU) and a device (GPU). The computation of tasks is done in GPU by a set of threads that run in parallel. The GPU architecture for threads consist of two-level hierarchy, namely block and grid (Figure 2). Block is a set of tightly coupled threads where each thread is identified by a thread ID, while grid is a set of loosely coupled of blocks with similar size and dimension [10].

The usage of GPU shows improvement performance in wide area such as Physical based simulation, signal processing, data processing, image segmentation, computer vision and image processing [10]. An example of the usage GPU for image processing is the work of Guo and Hei, they worked fractal image compression in GPU [11]. Their work can accelerate 123 times faster than before. Not only in image processing the usages of GPU become popular, but also in data processing. It shown in the work of Xu and Xu, they worked a hybrid shorting algorithm with the power of GPU and CPU. This work can short one billion 32-bit float in no more than 5 seconds [12].

Figure 2. CUDA Architecture

### 4. GPU Combined Parallel Image Inpainting

The acceleration inpainting process is a challenge to researchers. They are trying to use advance mathematical techniques to improve the computation time but there another way to accelerate inpainting process using parallel execution in GPU. We realize that the use of GPU in inpainting problem will reduce the computation latency time.

Image source and mask inpainting should be initialize in the CPU memory. In GPU memory, data only can be process in one dimensional array. Image data should be process to one dimensional array data. We will assign image source and mask to variable that can be transfer to GPU memory.

The threads of a block are processed in the same streaming processor (SM), and the parallelization depends on the number of cores in the SM. The GPU architecture has a limit in the number of threads per block. In this work, a NVIDIA GeForce GTX-670 card with up to 1,024 threads per block was used.

The computations of fast Fourier transform use the CUDA library. The step to call CUFFT library is: create plan, execute plan and destroy plan. The computations need double precision so we will use parameter CUFFT\_Z2Z, which indicate double complex to double complex computation.

Step 1 :	Image and mask inisialization
Step 2 :	Preprocessing data to transfer GPU
Step 3 :	Computation Variable inisialization
Step 4 :	Transfer data from CPU to GPU Memory ---- <i>Begin parallel data computation in GPU</i> ----
Step 5 :	GPU variable and workload inisialization
Step 6 :	Inizialisasi Calculation Parameter
Step 7 :	Parallel image and mask FF transform
Step 8 :	Parallel calculation curve
Step 9 :	Paralel curve FF transform
Step 10 :	Parallel Fourth Order PDE Inpainting in spectral domain
Step 11 :	Parallel Inverse FF transform of inpainting result
Step 12 :	Inizialisasi new curve <i>Step 9-12 will be repeated until fair image condition</i>
Step 13 :	Transfer data from GPU to CPU Memory
Step 14 :	Celan GPU Memory ---- <i>End parallel data computation in GPU</i> ----
Step 15 :	Preprocessing data to CPU
Step 16 :	Show and save image <i>Inpainting Result</i>

Figure 3. Algoritma parallel Inpainting fourth order PDE in GPU

We use the data variable from the research of Schönlieb, et al., [9]. The C1 variable is set to 200 and C2 variable is 100. We save this variable in register memory of GPU. The curve calculation result and the fourth order inpainting result will be saved in global memory.

After the iteration complete, the GPU will begin to transfer the data to CPU. The data will be process from the one dimensional array to two dimensional image array.

### 5. Result Inpainting Fourth Order GPU

The proposed method was simulated with an image of white rectangular on black background having the damage in the middle of the image. The damage area had gray colour. This image resolution was 100 x 100 pixels. The image test can be seen in Figure 3(a) while the required result should be seen as in Figure 3(f). This damage area can be easily seen in Figure 3(a) with gray colour in the middle of the image. This initial test image had high MSE (9,795.40), low PSNR (8.22) and low SSIM (0.81). These indicators indicated that the initial image had high damage and small similarity.

Table 1. Latency *Inpainting* process CPU and GPU

Iterations	Latency (sec)		
	CPU	GPU	Speedup
10,000	155.99	4.31	36.19
50,000	780.00	21.65	36.03
100,000	1,560.16	43.37	35.98
200,000	3,120.28	86.50	36.07

The latency of inpainting process using fourth order PDE has been noted both in CPU and GPU to repair the damage area. As shown in Table 1, the CPU computation time was slower than GPU computation time. The computation time for 10,000 iterations in CPU was 155.99s and in GPU was 4.31s. These were the computation time for 100,000,000 data (100 x 100 x 10,000 iterations). The computation time for 200,000 iterations in CPU was 3,120.28s and in GPU was 86.50s. These were the computation time for 2,000,000,000 data (100 x 100 x 200,000 iterations). The parallel computation using GPU was showing 36x latency speedup than using CPU.

Figure 4. (a) Test image with damage in the middle (b). Inpainting 10.000 iterations (c) Inpainting 50.000 iterations (d). Inpainting 100.000 iterations (e). Inpainting 200.000 iterations (f) Test image without damage

The GPU have been applied to solve inpainting problem using fourth order PDE equation in Equation (2). The result of the 10,000 iterations is shown in Figure 3(b). This image was trying to reconstruct the white rectangular in the middle of the image. In 10,000 iterations, the rectangular almost connected. In 50,000 iterations as shown in Figure 3(c), the white rectangular already connected and the black background was reconstructed. After 100,000 iterations, we can see only small area of black background that hasn't repaired like in Figure 3(d). In 200,000 iterations, Figure 3(e) already has the same structure like in Figure 3(f). This is proved by the SSIK value of 0.98.

Figure 5. Line chart of latency comparison GPU and CPU

Table 2. Image Quality Metric

Iterations	MSE	PSNR	SSIK
0	9,795.40	8.22	0.81
10,000	7,628.24	9.30	0.74
50,000	2,663.89	13.88	0.84
100,000	663.59	19.91	0.88
200,000	29.25	33.47	0.98

The outcome of inpainting process using fourth order PDE as simulated by the authors is shown in Figure 3(e) and the required result was shown is Figure 3(f). It was found that the iterations in GPU and the quality of the image are correlated. If we increase the iteration, the quality of the image will increase. It was shown in Table 2, that after 200,000 iterations the MSE decreased from 9,795.40 to 29.25 ,PSNR increased from 8.22 to 33,47 and SSIK increased from 0.81 to 0,98.

We use sample image to test the real problem repairing the damage picture. We used the three girls old grayscale portrait that have folded damage like in Figure 6(a). This picture dimension is 483 x 405 pixels. We are running the algorithm execution in both CPU and GPU.

Table 3. Latency *Inpainting* old portrait latency CPU and GPU

Iterations	Latency (sec)		
	CPU	GPU	Speedup
500	124,80	2,58	48,39
1.000	249,61	5,12	48,76
2.000	499,29	10,21	48,91

Similar from the simulation before, the CPU computation time was slower than GPU computation time. The computation time for 500 iterations in CPU was 124,80 s and in GPU was 2,58s. These were the computation time for 97.807.500 data (483 x 405 x 500 iterations). The computation time for 1.000 iterations in CPU was 249,61s and in GPU was 5,12s. These were the computation time for 195.615.000 data (483 x 405 x 1.000 iterations). The computation time for 2.000 iterations in CPU was 499,29s and in GPU was 10,21s. These were the computation time for 391.230.000data (483 x 405 x 2.000 iterations). The parallel computation using GPU was showing 48x latency speedup than using CPU.

Figure 6. (a) Damage picture; (b) Inpainting 500 iterations; (c) Inpainting 1.000 iterations; (d) Inpainting 2.000 iterations

The GPU have been applied to solve inpainting problem in Figure 6(a) using fourth order PDE equation in Equation (2). The result of the 500 iterations was shown in Figure 6(b). This image was trying to repair small damage in the body and the background, but we can still see the damage in the area around the girl eyes. In 1.000 iterations, the damage in the girl eye reduce this was shown in Figure 6(c). But the face line of the girl is not connected yet. In 2.000 the face line around the girls eye already connected like was shown in Figure 6(d).

## 6. Conclusion

In this paper, the authors presented a technique for accelerating inpainting problem using GPU as computation tools. This method aims to reduce the heavy computation problem of fourth order PDE and to employ the use of GPU in parallelism to gain computation speed. This improvement was accomplished by using NVIDIA GEFORCE GTX 670 to calculate data in parallel computation. The proposed concept proved a speedup to 36x in the simulation model and speedup to 48x in the simulation picture. It was also shown that the use of GPU CUDA can be applied in the image inpainting area.
