

V. SIMPULAN DAN SARAN

A. Simpulan

Berdasarkan hasil penelitian prevalensi malaria unggas pada burung berkik ekor-lidi (*Gallinago stenura*) dengan teknik mikroskopis dapat disimpulkan:

1. Terdapat parasit *Plasmodium* sp. penyebab malaria burung pada sel darah merah burung Berkik Ekor-lidi.
2. Tidak diketemukan kenampakan parasit *Leucocytozoon* sp dan *Haemoproteus* sp. dalam darah burung Berkik Ekor-lidi.
3. Terdapat 3 sampel yang positif terinfeksi parasit penyebab malaria burung dari total 17 individu burung Berkik Ekor-lidi yang dianalisis dengan prevalensi 17,64 %.
4. Perbandingan burung yang terinfeksi malaria burung di pantai Trisik relatif lebih rendah prevalensinya dibandingkan dengan infeksi malaria unggas di Asia khususnya Myanmar, India dan Korea Selatan.

B. Saran

1. Perlu adanya penelitian lanjutan untuk menganalisis apakah interaksi infeksi malaria burung dapat terjadi antar jenis burung lokal dan migran.
2. Meneliti dan mengkaji faktor lain (vektor, gejala klinis, interaksi infeksi antara burung lokal dan migran) yang mendukung masih terjadinya infeksi parasit penyebab malaria burung.

3. Perlu adanya peningkatan kualitas alat pengamatan atau mikroskop untuk ukuran perbesaran dan teknologi pendukung agar meningkatkan kualitas hasil pengamatan.
