DECLARATION

I hereby declare this final project report with the title:

THE USE OF MAGNETORHEOLOGICAL DAMPERS AS SEMI ACTIVE DEVICE FOR STRUCTURES SUBJECTED TO EARTHQUAKE

is my own work and not plagiarism. Idea, results or quotations which are from other sources are stated in this final report.

Acknowledgement

I wish to express my profound gratitude to my supervisor, Prof. Ir. YoyongArfiadi, M.Eng., Ph.D for his invaluable advice and guidance during the completion of this report. I would like also to thank to Dr. Ir. A.M Ade Lisantono, M.Eng, dean of civil engineering department at Universitas Atma Jaya Yogyakarta and all lecturers in Engineering Faculty UAJY.

I would like to thank to PCMI and Australia-Indonesia Youth Association as my youth organization for allowing me to learn and give new experience in my life.

Finally, I would like to express my deepest gratitude to my parents whose support and prayer become my strength during this completion.

NOTATIONS

a_k	= proportional constant that relates damping and stiffness
$\left. \begin{array}{l} \mathbf{A} \\ \mathbf{B} \end{array} \right\}$	= system matrices in state space equation $\dot{\mathbf{Z}} = \mathbf{AZ} + \mathbf{Bu} + \mathbf{Ew}$
\mathbf{E}	
A_b	= area of the beam
A_c	= area of the column
b_i	= vector representing the location of the i th control force
b_s	= control force location matrix
c	= damping
\mathbf{C}_{3D}	= damping matrix of three-dimensional building
\mathbf{C}_s	= damping matrix
\mathbf{C}_y	= measurement matrix
\mathbf{d}_C	= displacement to be condensed
\mathbf{d}_R	= displacement to be retained
E	= modulus of elasticity
f	= external force
\mathbf{I}	= matrix identity
\mathbf{ID}	= destination vector
I_x	= second moment area of the floor with respect to X axis

I_{yb}	= second moment area of the beam with respect to y_m axis
I_{yc}	= second moment area of the column with respect to y_m axis
I_{zb}	= second moment area of the beam with respect to z_m axis
I_{zc}	= second moment area of the column with respect to z_m axis
I_y	= second moment area of the floor with respect to Y axis
J	= torsional constant
k	= stiffness
\mathbf{K}_{3D}	= stiffness matrix of three-dimensional building
\mathbf{K}_{CC}	} = partition of the stiffness matrix
\mathbf{K}_{CR}	
\mathbf{K}_{RC}	
\mathbf{K}_{RR}	
\mathbf{K}_C	= element stiffness in terms of Global Frame Coordinate Systems
\mathbf{K}_s	= stiffness matrix
m	= mass
M	= total mass of the floor
\mathbf{M}_{3D}	= mass matrix of three-dimensional building
\mathbf{M}_s	= mass matrix
MMI	= mass moment of inertia of the floor
n	= total degrees of freedom
N	= total number of floors

NRJ	= total number of restrained joints
NTF	= total number of joints at the floor
NTJ	= total number of joints of the structure
\mathbf{T}_R	= transformation matrix
\mathbf{u}	= control force vector
V	= Lyapunov function
\mathbf{X}_{3D}	= displacement vector of three-dimensional structures
\mathbf{X}_s	= displacement vector
$\dot{\mathbf{X}}_s$	= velocity vector
$\ddot{\mathbf{X}}_s$	= acceleration vector
y	= storey drift
\mathbf{y}	= measurement vector
\mathbf{Z}	= state vector
Δ_F	= displacement of the structure in terms of Global Frame Coordinate Systems
Δ_{FC}	= displacement of the structure to be condensed out
Δ_{FR}	= displacement of the structure to be retained

ABSTRACT

Awareness of engineers in designing earthquake resistant building is arising nowadays. Many strategies have been developing by the researchers to get high performance in reducing earthquake responses. Semi-active control strategy under earthquake loading is discussed in this report will be applied in three dimensional three-storey building. In addition, the device has been added with magnetorheological fluid which will act as the liquid damper.

Firstly is to fulfill all parameters in non-linear control strategy based on the building properties. Furthermore, the force of the device in semi-active control strategy will be analyzed with MATLAB to get displacement response by comparing passive on, passive off control and Lyapunov method

The results of the simulation comparing the uncontrolled building result with semi-active control strategies (uncontrolled-passive off; uncontrolled-passive on; uncontrolled-Lyapunov method) show satisfactory result with displacement response reduction on the first floor are 31.5%, 37.5% and 48.35%, the results on the second floor are 30.7%, 30.5% and 40.2% and the results on the third floor are 26.5%, 29.8% and 40%.

Keywords : semi-active control strategy, magnetorheological fluid, passive on, passive off, Lyapunov method, MATLAB
