STATEMENT

I, who signed below with the final project title of:

“DEVELOPING AN ONTOLOGY FRAMEWORK TO ANALYZE INFORMATION REQUIREMENTS OF BIM DEVELOPMENT FOR CONSTRUCTION COST MANAGEMENT”

states that this final project is the result of my own work and not a plagiarism of other people's work. Idea, research data, and quote whether directly or indirectly derived from other's writings or ideas are properly cited in this Final Project. If it is proven later that this Final Project is a result of plagiarism, the graduation certificate that I received will be canceled and returned to Universitas Atma Jaya Yogyakarta accordingly.

Yogyakarta,

In charge of the agreement,

Andreas Budi Hartono

ACKNOWLEDGEMENTS

First of all, I would like to thank Jesus Christ for His blessing upon me, so that I could prepare and finished my final project report on time. The purpose of this final project with the title “Developing an Ontology Framework to Analyze Information Requirements of BIM Development for Construction Cost Management” is to complete the requirement of undergraduate program (S-1) in International Civil Engineering Program, Department of Civil Engineering, Faculty of Engineering, Universitas Atma Jaya Yogyakarta. By the completion of this final project, I would also like to express my gratitude towards:

1. Ir. AY. Harijanto Setiawan, M. Eng., Ph.D., as my undergraduate final project supervisor for his advice and kindness given to me especially during the preparation of 3+2 program. His support and advice had been very meaningful to me.
2. Assc. Prof. Feng Chung Wei, Ph.D., as my thesis advisor for his kind help upon introducing me to BIM and many other sophisticated technology in construction management program. It is the most valuable knowledge I got during my first year studying in NCKU, Taiwan.
3. Dr. Eng. Luky Handoko, S.T., M.Eng., as the Vice Dean of Engineering Faculty, Universitas Atma Jaya Yogyakarta. His effort in introducing and preparing me for 3+2 Program in NCKU Taiwan was beyond blessing.
4. Johan Ardianto , S.T., M.T., as the current coordinator of Civil Engineering Program for the brotherly support to me, its been a very precious bond for me.

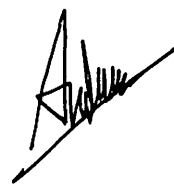

5. My parents, sister and my girlfriend Monic for the never ending love, support, and patience given to me to finish this final project.
6. My fellow Taiwanese friends especially Even, Zhe Ming and my other lab mates who helped me a lot working with this topic. Without your guys' help, I might not be able to finish this final project on time.
7. All of my friends, juniors, and seniors in Civil Engineering Department especially from the DeBritto High School and ICEP for their support and cooperation that help me to complete this report.

Finally, I do realized that this report may have flaws and space for further improvements. Therefore, any suggestion or critic will be gladly accepted.

Thank you.

Yogyakarta, July 2019

Final Project Author,

A handwritten signature in black ink, appearing to read 'Andreas Budi Hartono', written over a diagonal line that extends from the bottom left towards the top right.

ABSTRACT

DEVELOPING AN ONTOLOGY FRAMEWORK TO ANALYZE INFORMATION REQUIREMENTS OF BIM DEVELOPMENT FOR CONSTRUCTION COST MANAGEMENT, Andreas Budi Hartono, Student ID Number 15.13.16189, year of 2019, Construction Management, International Civil Engineering, Universitas Atma Jaya Yogyakarta.

Delivering construction project requires a mature approach as the nature of every project is unique and different. This issue often leads to inaccurate cost management upon delivering construction project. As technologies are growing rapidly nowadays, there have been several technologies developed to help engineer manage construction project. Building Information Modelling (BIM) is one of the technologies recently used in construction project as it has a broad capability of management purpose. However, a standalone BIM model wouldn't be enough to overcome this issue as a mature approach to fully utilize BIM model is required. By understanding the proper approach upon developing and processing BIM model, engineer could get the maximum benefits upon implementing BIM technology in construction project.

The purpose of this study is to examine the terms of accurate and reliable cost management, develop a framework according to the terms examined and eventually able to implement this framework upon developing BIM model that satisfy cost management purpose. Several criteria of reliable cost management are determined and later used to review a construction work measurement standard. Ontological approach is used to assemble these term and standard into an interactive framework. Later, a BIM model of actual construction project is developed and assessed using this framework so that it could satisfy the information requirements of cost management purpose.

The result of this study shows that by developing the BIM model up to Level of Detail (LOD) 300 is still not enough to provide the required information specified in the ontology framework. There are several limitations of the BIM software used that cause the inability to accurately provide this information. Further analysis upon developing and analyzing BIM model is carried out to overcome this limitation. Through customized parameter and plugin used in the software, the BIM model could eventually provide a satisfactory and accurate information for cost management purpose in the ontology framework.

Key Words: Cost Management, Ontology, Building Information Modelling (BIM)
