

## **BAB V**

### **KESIMPULAN DAN SARAN**

#### 5.1. Kesimpulan

Beberapa kesimpulan yang didapatkan dari penelitian Portofolio Optimal dalam Sektor Properti, Real Estate dan Konstruksi Indonesia adalah sebagai berikut.

1. Dari hasil penyeleksian portofolio optimal dengan model indeks tunggal pada tingkat suku bunga SBI rata-rata 3 bulan sebesar 0,76% terbentuk 23 saham dalam portofolio optimal.
2. Tingkat return ekspektasi pada portofolio optimal didapatkan sebesar 4,4289 % sedangkan untuk risiko portofolio optimal didapatkan sebesar 0,0417.
3. Dari hasil perhitungan proporsi didapatkan 5 perusahaan dengan nilai proporsi yang tergolong tinggi berkisar 6 % - 9 % yaitu DIDL, MORE, DUTI, PWON dan SSIA dan 7 perusahaan yang tergolong rendah berkisar 0 % - 3 % yaitu ELTY, RODA, LAMI, PWSI, JAKA, BKSL dan PTR. Sedangkan sisanya berada diantara 3% - 6 % yang tergolong sedang terdapat 11 perusahaan yaitu KPIG, SIIP, LPKR, LPCK, BIPP, BMSR,DART, JRPT, RBMS, SMDM, dan CKRA. Untuk proporsi tertinggi didapatkan sebesar 7,6556% oleh saham DIDL dan proporsi terendah didapatkan sebesar 0,8997 % oleh saham PTR.

4. Pada pengujian pengaruh perubahan tingkat suku bunga SBI untuk melihat tingkat sensitivitas terhadap portofolio optimal. Untuk melihat pengaruh ini dilakukan asumsi beberapa nilai tingkat suku bunga SBI dengan kelipatan 1% dan hasilnya menunjukkan bahwa pada saat tingkat SBI rata-rata berada pada level 8% hanya ada satu saham yang bertahan dan pada saat tingkat suku bunga SBI rata-rata berada pada level 10% saham-saham pada sektor properti, real estate dan konstruksi dianggap tidak begitu menarik lagi dan investor yang rasional seharusnya memilih untuk berinvestasi pada SBI daripada saham properti, real estate dan konstruksi.

#### 5.2. Saran

Adapun beberapa saran mungkin bermanfaat sebagai pertimbangan-pertimbangan yaitu sebagai berikut ini.

1. Dalam penelitian tentang efek diversifikasi oleh Fama (1976) dari 50 saham. Fama menyimpulkan keuntungan diversifikasi dapat dicapai hanya dengan sekuritas yang tidak terlalu banyak yaitu kurang lebih dari 15 saham sudah dapat mencapai diversifikasi yang optimal. Sedangkan pada hasil diatas didapatkan 23 saham dalam pembentukan portofolio optimal. Hal ini mungkin terjadi karena pengaruh tingkat suku bunga SBI yang terlalu kecil sehingga saham-saham lain menjadi terlalu mudah untuk masuk syarat yang diberikan oleh model indeks tunggal dalam pembentukan portofolio optimal. Sehingga untuk pembandingnya mungkin bisa menggunakan aktiva lain yang memiliki risiko seperti SBI

tetapi memiliki tingkat return yang lebih tinggi untuk mendapatkan hasil yang lebih optimal.

2. Tingkat keakuratan model indeks tunggal tergantung pada seberapa realistik asumsi yang diberikan. Dan salah satu kelemahan model indeks tunggal adalah tidak memberikan asumsi atau perhitungan yang meninjau korelasi antar saham, sehingga tingkat return dan risiko yang terjadi mungkin lebih besar ataupun lebih kecil.
