

BAB VI

KESIMPULAN DAN SARAN

6.1. Kesimpulan

Dari hasil penelitian yang telah dilakukan pada campuran aspal beton dengan penambahan karet sol yang terendam air laut, dapat disimpulkan sebagai berikut:

1. Sifat-sifat campuran aspal beton berdasarkan nilai karakteristik *Marshall*:
 - a. Nilai *density* campuran aspal beton semakin lama direndam dalam air laut, akan semakin menurun. Penambahan karet sol pada campuran aspal beton cenderung menurunkan nilai *density* dibandingkan campuran aspal beton tanpa penambahan karet sol.
 - b. Nilai VFWA campuran aspal beton semakin lama terendam dalam air laut, nilai VFWA campuran menurun.. Nilai VFWA campuran dengan penambahan karet sol cenderung mengalami penurunan dibandingkan dengan campuran tanpa penambahan karet sol.
 - c. Nilai VITM campuran aspal beton semakin lama terendam dalam air laut, nilai VITM campuran meningkat. Nilai VITM pada campuran aspal beton dengan penambahan karet sol cenderung mengalami peningkatan dibandingkan campuran aspal beton tanpa penambahan karet sol.
 - d. Nilai stabilitas campuran aspal beton, semakin lama terendam dalam air laut, nilai stabilitas campuran menurun. Nilai stabilitas pada campuran dengan penambahan karet sol cenderung mengalami penurunan

dibandingkan dengan campuran tanpa penambahan karet sol untuk campuran aspal beton yang tidak terendam air laut.

- e. Nilai *flow* campuran aspal beton, semakin lama terendam dalam air laut, nilai *flow* campuran akan meningkat. Nilai *flow* campuran dengan penambahan karet sol cenderung mengalami penurunan dibandingkan dengan campuran tanpa penambahan karet sol.
- f. Nilai *Marshall Quotient* campuran aspal beton semakin lama terendam dalam air laut, nilai *Marshall Quotient* campuran menurun. Hal ini menunjukkan campuran aspal beton jika semakin lama direndam dalam air laut fleksibilitasnya akan semakin tinggi. Semakin banyak kadar karet sol yang diberikan pada campuran aspal beton, nilai *Marshall Quotient* akan turun yang berarti campuran bersifat lembek.

2. *Density*, stabilitas, VFWA, dan *Marshall Quotient* dari campuran aspal beton yang terendam air laut, semakin lama perendaman dalam air laut, akan semakin menurun. VITM dan *flow* campuran aspal beton yang terendam air laut, semakin lama perendaman dalam air laut akan semakin meningkat, karena air laut menyebabkan daya rekat antar butiran campuran berkurang. Campuran aspal beton dengan penambahan karet sol yang terendam air laut nilai VFWA, stabilitas, dan *Marshall Quotient* cenderung menurun dibandingkan campuran aspal beton tanpa penambahan karet sol, sedangkan nilai VITM dan *flow* campuran dengan penambahan karet sol cenderung meningkat dibandingkan campuran aspal beton tanpa karet sol, karena karet sol dapat membuat campuran aspal beton semakin lembek, sehingga aspal

beton yang terendam air laut memiliki daya tahan yang lebih baik dibandingkan dengan aspal beton tanpa penambahan karet sol. Akan tetapi, aspal beton dengan tambahan karet sol yang terendam air laut ini hanya dapat bertahan hingga 4 hari yaitu pada penambahan karet sol sebesar 10 %. Berdasarkan nilai karakteristik *Marshall*, campuran aspal beton yang memiliki umur ketahanan terhadap air laut paling lama yaitu 3 dan 4 hari adalah pada campuran kadar aspal 5,5% dan penambahan karet sol 10%.

6.2. Saran

Setelah dilakukan penelitian, dapat diberikan saran sebagai berikut.

1. Penelitian sejenis dapat dilakukan dengan menggunakan karet jenis lain yang dapat memberikan ketahanan yang lebih lama pada perendaman air laut.
2. Mengingat dalam penelitian ini tidak ditinjau pengaruh sifat kimiawi dari karet sol, maka perlu dilakukan penelitian lebih lanjut dengan meninjau sifat kimianya untuk membedakan jenis karet sol yang satu dengan yang lain.

Jl. Babarsari No.44 Yogyakarta 55281 Indonesia Kotak Pos 1086
Telp. +62-274-487711 (hunting) Fax. +62-274-487748

Keterangan :

a = % aspal terhadap batuan

b = % aspal terhadap campuran

c = berat (gram)

d = berat dalam keadaan jenuh (gram)

e = berat dalam air (gram)

f = isi (ml) = d - e

g = berat isi benda uji

h = berat jenis maksimum = c/f

$$= \frac{100}{\frac{\% Agregat}{BJAgregat} + \frac{\% Aspal}{BJAspal}}$$

$$i = \frac{bxg}{BJAspal}$$

$$j = \frac{(100-b)g}{BJAgregat}$$

k = jumlah kandungan rongga (%) = 100 - i - j

l = prosen rongga terhadap agregat = 100 - j

m = prosen rongga terisi aspal 100 x i/l (%)

n = prosen rongga terhadap campuran = 100 - 100g/h (%)

o = pembacaan arloji stabilitas

p = stabilitas (o x kalibrasi alat) (kg)

q = stabilitas (p x koreksi benda uji) (kg)

r = kelelehan (0,01°)

1 = suhu pencampuran = 160°

2 = suhu pemadatan = 140°C

3 = suhu perendaman = 60°

Mengetahui,
Kepala Laboratorium Transportasi

(Ir. JF Soandrijanie L., M.T.)
