

## **V. SIMPULAN DAN SARAN**

### **A. Simpulan**

Berdasarkan hasil penelitian dapat diambil beberapa simpulan sebagai berikut:

1. Fase lag terjadi antara jam ke-0 sampai dengan jam ke-2, dengan perolehan hasil tertinggi  $1,12 \cdot 10^7$  sel pada perlakuan tiga perlakuan yaitu perlakuan 3, 9 dan 11. Fase eksponensial, terjadi antara jam ke-4 sampai dengan jam ke-16, hasil terbesar diperoleh pada jam ke-14 dengan perlakuan variasi konsentrasi molase 10% dan amonium sulfat 1 g/l hasilnya sebesar  $29,6 \cdot 10^7$  sel. Fase stasioner terjadi pada jam ke-16 sampai dengan jam ke-22 dengan perolehan hasil berkisar antara  $16 \cdot 10^7$ - $25 \cdot 10^7$  sel pada tiap perlakuan. Fase kematian dimulai pada jam ke-24 dengan perolehan hasil tertinggi sebesar  $21,6 \cdot 10^7$  pada perlakuan variasi konsentrasi molase 10% dan amonium sulfat 4 g/l.
2. Kadar alkohol hasil penelitian yang tertinggi adalah 2,42%, dijumpai pada fase stasioner terjadi pada jam ke-24 dengan perlakuan variasi konsentrasi molase 20% dan variasi konsentrasi amonium sulfat 2 g/l.

### **B. Saran**

Berdasarkan hasil penelitian yang telah dilakukan, perlu adanya penelitian lebih lanjut yang mengkaji tentang :

1. Pada penelitian ini dilakukan pengamatan selama 24 jam, untuk mendapatkan hasil yang lebih sempurna maka waktu inkubasi bisa ditambahkan menjadi 36

jam, untuk mendapatkan pola pertumbuhan yang lebih jelas grafiknya sehingga produksi alkohol dapat ditentukan hasil yang maksimal dengan perlakuan variasi konsentrasi molase dan amonium sulfat.

2. Pada penelitian yang sama dapat ditambahkan pengukuran pH yang optimum untuk pertumbuhan *Saccharomyces cerevisiae*, sehingga akan diperoleh kadar alkohol yang lebih tinggi.

### **1. Pembuatan Medium Nutrien-Cair (Jutono *et al.*, 1980)**

Timbang dengan teliti bahan-bahan yang akan digunakan seperti pepton 5 g dan ekstrak taoge 3 g. Kemudian masing-masing bahan dilarutkan dalam 1000cc aquades hingga menjadi larutan yang homogen. Panaskan dalam penangas air hingga larutan medium mendidih selama 5 menit. Dinginkan, kemudian netralkan larutan medium tersebut menggunakan NaOH 1 N sedikit demi sedikit sampai warna indikator phenolphthalein berubah menjadi merah jambu. Aquades yang hilang selama pemanasan supaya diganti dengan menambahkan aquades sampai volumenya tepat 1.000cc. larutan disaring dengan kapas atau kain penyaring yang bersih. Sterilisasikan dengan menggunakan autoklaf pada tekanan 2 atm (temperatur 121°C selama 15 menit).

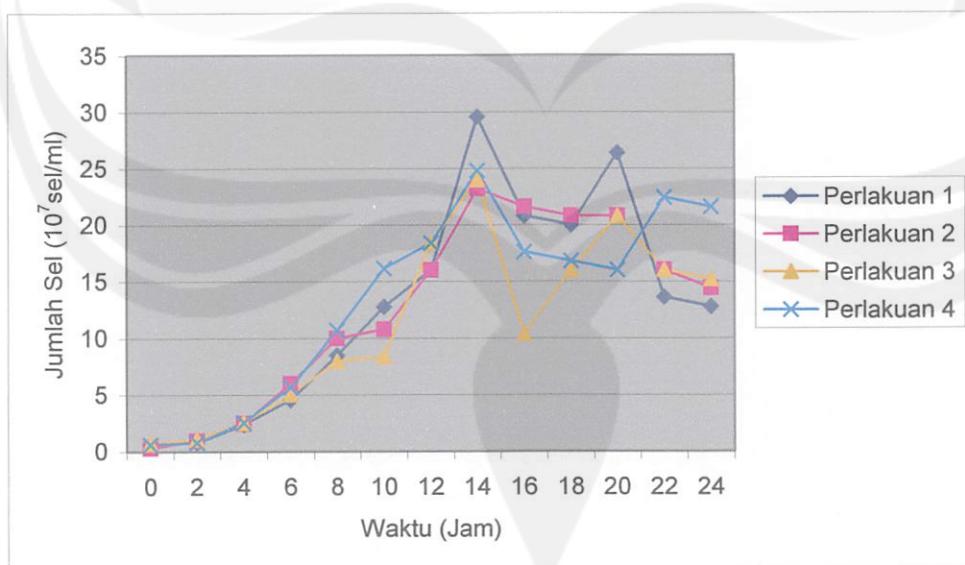

### **2. Pembuatan Medium Nutrien Agar Miring (Jutono *et al.*, 1980)**

Medium nutrien cair dibuat seperti di atas, kemudian ditimbang agar-agar sebanyak 15-20g untuk setiap 1000cc medium (1,5-2%). Masukkan agar-agar kedalam medium kemudian panaskan dalam penangas air selama 20-30 menit sambil diaduk hingga semua agar-agar mencair dan larut. Aquades yang hilang selama pemanasan supaya diganti dengan aquades sampai volume semula, bila perlu dilakukan pengaturan pH sekali lagi.. kemudian dalam keadaan panas medium nutrien agar disaring dengan kapas atau kain saring yang bersih. Masukkan medium tersebut kedalam tabung-tabung reaksi yang steril, untuk medium agar miring diisikan 5cc medium. Sterilkan dengan autoklaf pada tekanan 2 atm (temperatur

121°C selama 15 menit). Medium agar miring setelah sterilisasi diletakkan miring 30° terhadap bidang datar dan biarkan sampai menjadi padat.

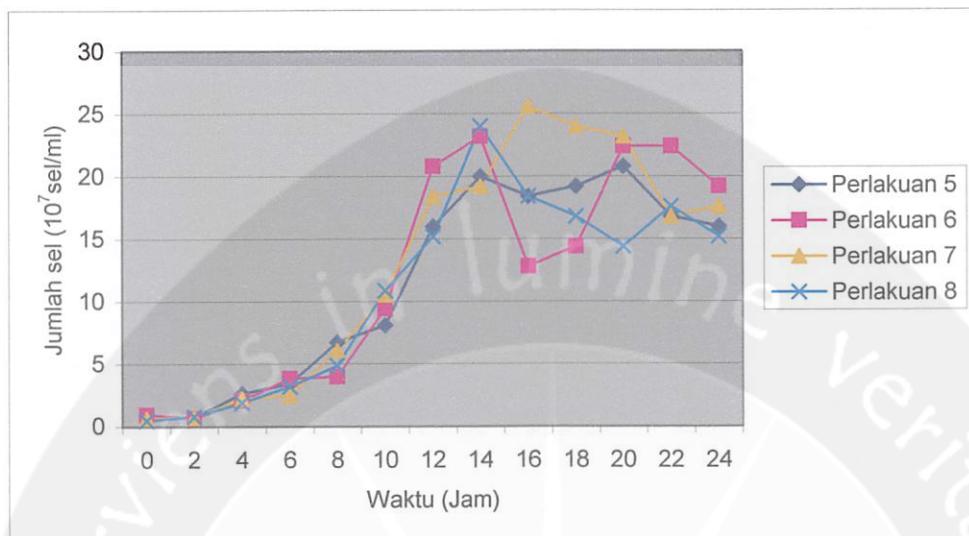

### 3. Pembuatan Wort Agar (Jutono *et al.*, 1980)

Diambil 20g medium wort instan kemudian ditambahkan dengan 10g glukosa, dilarutkan dengan aquades sebanyak 1000cc. Bahan tersebut dipanaskan selama 20-30 menit sambil diaduk. Aquades yang hilang waktu pemanasan supaya diganti dengan aquades sampai volume semula, bila perlu dilakukan pengaturan pH. Masukkan medium kedalam erlenmeyer yang steril, kemudian sterilkan dengan autoklaf pada tekanan 2 atm (temperatur 121°C selama 15 menit). Medium yang sudah disterilkan dan dalam keadaan dingin simpan dialmari es.
