

BAB V

KESIMPULAN DAN SARAN

V . 1 Kesimpulan

Hasil pembahasan seluruh model struktur dengan tinggi dinding geser 0 % sampai dengan 100 % dari tinggi total struktur yang meliputi waktu getar struktur, defleksi, *base shear reaction* dan *base moment reaction*, gaya geser kolom dan balok, dan momen kolom dan balok dapat disimpulkan beberapa hal sebagai berikut ini.

1. Analisis respon spektrum dari seluruh model menghasilkan waktu getar struktur terbesar pada waktu getar alaminya, yaitu pada *mode shape 1st*. Waktu getar alami terkecil terjadi pada model struktur dengan tinggi dinding geser 80 % dari tinggi total struktur.
2. Defleksi rata-rata terendah untuk arah sumbu global X dan Y terjadi pada struktur dengan tinggi dinding geser 80 % dari tinggi total struktur. Untuk arah sumbu Z, pengaruh tinggi dinding geser yang efektif hanya sampai pada struktur dengan tinggi dinding geser 80 %, selebihnya tidak menunjukkan pengaruh yang berarti.
3. Dengan asumsi berat struktur yang tidak berubah atau tidak dipengaruhi perubahan berat dari berubahnya tinggi dinding geser maka didapat *base shear reaction* dan *base moment reaction* yang sama. Jika dengan asumsi berat struktur bertambah sejalan dengan bertambahnya tinggi dinding

geser maka didapat *base shear reaction* dan *base moment reaction* yang bertambah besar. Dengan kata lain *base shear reaction* dan *base moment reaction* lebih tergantung pada berat dan massa struktur.

4. Adanya dinding geser menyebabkan penurunan gaya geser pada kolom-kolom selain kolom tengah portal yang berhimpit dengan dinding geser. Pada kolom-kolom yang berhimpit dengan dinding geser justru mengalami kenaikan.
5. Struktur dengan tinggi dinding geser 80 % dari tinggi total struktur adalah tinggi efektif dalam menurunkan gaya geser kolom, karena dinding geser yang ada berfungsi dengan baik pada tingkat-tingkat bawah sampai dengan tingkat-tingkat atas. Pada tingkat-tingkat atas yang tidak berdinding geser, gaya geser kolomnya tidak berbeda jauh dengan struktur yang memakai dinding geser penuh sehingga pemakaian dinding geser pada tingkat-tingkat atas tidak akan efektif.
6. Jika ditinjau dari momen kolomnya, pemakaian dinding geser yang efektif hanya pada struktur dengan tinggi dinding geser 70 % sampai dengan 90 % dari tinggi total struktur. Pada ketinggian tersebut, dinding geser berfungsi efektif di semua tingkat struktur.
7. Gaya geser balok dan momen balok mengalami penurunan dengan bertambahnya tinggi dinding geser. Selain mempunyai ketahanan geser yang besar terhadap gaya lateral, dinding geser juga mempunyai ketahanan geser yang besar terhadap gaya vertikal.

Secara keseluruhan dari hasil rekapitulasi pembahasan tersebut dapat disimpulkan bahwa pada sistem struktur portal – dinding geser yang berdinding geser penuh, ternyata dinding geser yang berada di tingkat-tingkat atas struktur tidak lagi berfungsi efektif terhadap struktur. Dinding geser akan lebih efektif jika hanya dibatasi sampai pada ketinggian 80 % dari tinggi total struktur.

V . 2 Saran

Saran yang dapat diajukan dari hasil kesimpulan yang telah dikemukakan adalah sebagai berikut ini.

1. Penggunaan dinding geser untuk menahan beban gempa sebaiknya dibatasi hanya sampai pada ketinggian 80 % dari tinggi total struktur.
2. Perlu adanya penelitian lebih lanjut dengan bentuk struktur dan bentuk dinding geser yang berbeda, letak dinding geser yang berbeda, atau dimensi dinding geser yang berbeda.
